

VALPLAST PARTIALS

Patient presented with a desire to replace her old partial with Valplast to eliminate the metal hooks.

The new Valplast partial blends in more naturally with the surrounding gum tissues and teeth.

The benefits of using the metal and Valplast together is the improved strength and extra support.

The Valplast partial appears to look more natural and smooth for patient comfort.

Ask your dentist if Valplast will benefit you.

"Best of all, no one knows I'm wearing a partial denture."

Valplast®

*Durable & Esthetic Thermoplastic
Removable Partial Denture*

How can Valplast improve your appearance?

To restore missing teeth, one of the typical solutions your dentist may offer is a metal and acrylic partial denture. While these restorations replace your missing teeth, they unfortunately have metal clasps that can be seen when you smile. Visible metal is unsightly and unnatural in an otherwise beautiful smile.

Visible metal makes a beautiful smile less appealing.

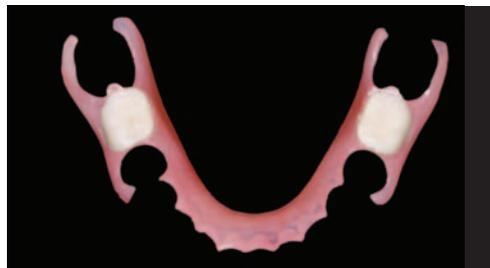

Valplast is an advanced solution for the replacement of missing teeth. It is based on modern thermoplastic technologies. Unlike metal, Valplast blends naturally with your teeth and gums, enhancing the appeal of your smile.

Valplast is attractive and blends with your smile.

Why is Valplast more comfortable?

Valplast was developed specifically to provide the precision fit and strength needed for the fabrication of metal-free partial dentures. In addition, Valplast has a gentle feel and a more secure fit.

Valplast clasps gently surround your natural teeth, providing a secure and comfortable fit.

Valplast exhibits 26% greater softness than the acrylics used on typical metal partials. Valplast is more comfortable than these typical acrylics, and in fact, it's even 65% stronger.

Valplast is softer, more comfortable, and stronger than typical acrylics used in partial dentures.
